

- in huawei router we cant set routing there fore i did not set the router after the firewall it is useless. there fore i put the huwarei router before the firewall and it can be use to wireless users and in firewall i add the routing and restrict the acceessibility of networks by defining ipv4 policies.
- I didi not use inbuilt DMZ port in firewall - becuaese just for fun only.
- In Userse Network devices ,they all need to go through the Proxy server to connect the internet..so users internet activity can be monitored.(Squid Proxy service in Server)
- When coming request through WAN to servers those request will come through the reverser proxy .(nginx service in server).
- Need Enterprise level network router to create a well structured netowrk.
In this network it is not well structured one ..so there can be vulnerabilities as well.
- printers ip not changed because HR using the printer , HR using 192.168.1.X network. - so that configuration some what wrong.
